To conduct competitions like these improve organizational skills and Work projects are typically centered on a rigid timeline, and organizing smaller projects and goals can be an effective way to complete them.

Date:01/09/2022

Name of Organizing Department or Committee: Department of Physics

Name of the activity: NEP based Demonstration Activity for B.Sc. Semester III (Paper I)

Suggested CRITERION point if any: Restricted to RTMNU B.Sc. physics syllabus.

Date of Activity: 01/09/2022

Place of Activity: Room no. 004

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA

Title of the Activity: Demonstration of sound travel through stretched string

Activity with newspaper coverage if any: No

Number of Participants: B.Sc. Semester III Students - 50

Name of the Teacher In-charge / Convener: Dr. Nayana Sonwane

Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

To know the sound travel through stretched string, sonometer instrument was used. Typically, sonometer consist of a long hollow box, AFO (Audio Frequency Oscillator), two movable bridges, a copper wire called string, and different weights. In this activity, we have demonstrated the formation of sound waves due to the resonance occurred in the string that has been attached with the load. The resonance in the string caused due to the AFO. The students witness the different parameters effecting the frequency of sound produced such as length between two bridges, tension in the string, and length per unit area of the string. They have also learned how the tension and velocity of the standing waves are related in the experiment.

Name of the activity: NEP based Demonstration Activity for B.Sc. Sem-V

Suggested CRITERION point if any: Restricted to RTMNU BSc physics syllabus.

Date of Activity: 23/09/2022

Place of Activity: Room no. 004

Title of the Activity: Demonstration Analogical explanation of Pauli's exclusion principle

Activity with newspaper coverage if any: No

Number of Participants: BSc Sem-V Students - 23

Name of the Teacher In-charge / Convener: Mr. Nishant Zode

Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

This demonstration provided an opportunity to BSc Sem-V students to learn the phenomenon analogical explanation of Pauli's exclusion principle. The Pauli Exclusion Principle states that in a single atom no two electrons will have an identical set or the same quantum numbers (n , l , m_l , and m_s). To put it in simple terms, there are two person of same name living in same city (principle quantum number n), same ward (l), same building (m_l) but different floor (m_s) can relate with actual situation for electron. This example help to understand student how the exact electron would be in energy state.

Date of Activity: ~~26~~09-2022

Place of Activity: Chemistry Laboratory

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: _____

Title of the Activity: Uses of salt bridge and Demonstration of preparation of salt bridge in laboratory
(Sem V, Paper II Unit I)

Number of Participants: 40

Name of the Teacher In-charge / Convener: Dr Deepika Brijpuriya

Names of other Committee Members / Staff: Dr Vaishali Meshram

OUTCOME of the Activity with respect to mission vision of the institute and or academics:

The activity based on the concept of role of salt bridge (ion bridge) in electrochemistry. Salt bridge plays a very important role in connecting two different electrolytes for mobility of ions. The preparation of salt bridge was demonstrated to the students, with all precautions (There should not be any air bubble, both the end level should be same, etc.). By this activity, students learn to prepare salt bridge and its wide applications in electrochemistry.

VISIT TO INDIRA GANDHI HOSPITAL FOR ACID FAST STAINING

PLACE:- INDIRA GANDHI HOSPITAL
DATE:-8TH OCTOBER 2022

Hospital visit was organized by Dr. Vidya kathoke Mam. The hospital visit started on time 10pm. We visited a hospital for acid fast staining and a blood bank room. First of all we saw the blood bank room. On the first floor we got the information about blood donation.

Hospitals offered their valuable services for blood donation. In blood Bank room Mam told that how the separate blood components like as plasma, WBCs, RBCs, platelets in Quality control room. we also got the information about blood donor and Recipient (patient). Blood donor Person should be age above 18+ and blood donor person should not be infected for the donation of blood. Before blood donation first of donor should be check B.P and diabetes and sugar test. Blood donor person (Girl) should have hemoglobin 15.

In the blood bank room we saw some machines such as Laminar flow in the refreshment room for patients. After visiting the blood bank room we visited a lab for Acid fast staining. We got information about Acid fast staining occurred in such type of microorganism which have waxy covering in bacterial cell. Due to this covering in bacterial cell Acid fast staining done.

This type of organism do not get decolorized By strong agent. In Acid fast staining some strong reagents into the bacterial cell First of all taken sputum of T.B. patient and made a smear on the slide. Reagents are used such as carbol fushion, H₂SO₄ acid, Methylene blue. In Acid fast staining

Mycobacterium colonies detected which is red coloured rod shape.

After that we visited the PCR Room where CBNAAT machines were available and in that machine cartridges contained sputum samples and were then placed in CBNAAT machines. CBNAAT machine connected with monitor

and shown the report about T.B. the patient. Machine required a high temperature in a cold room. Monitor displayed report of T.B. patient Negative then Rifampicin drug not given to the patient. If the report of

T.B. is positive i.e. person was infected with T.B. disease. this patient is diagnosed that the body resist Rifampicin or it was sensitized to it. If it resist Rifampicin then second line drugs was given for treatment. If it sensitized Rifampicin then 1st line drugs was given for treatment. Two types of patient T.B. patient. 1- pulmonary tract T.B. 2- Extra pulmonary tract TB for diagnosis, x-ray, gene -Expert PCR, True north and is Acid fast Staining is done. Two machines was used for diagnosis CABINET, True nert.

ADVANTAGES OF CABINET OVER TRUE NERT

- 1- There was no manual work carried out in CABINET. Whole process of testing is machine based.
- 2- It had good result accuracy as compared to True nert.

ADVANTAGE OF TRUE NERT OVER CABINET

- 1- CABINET required high temperature AC- Room and true nert was flexible in any temperature it can be shifted to any place for diagnosis and testing
- 2- CABINET was more expensive and true-nert was cheaped but less accuracy to result.

VISIT TO INDIRA GANDHI HOSPITAL FOR ACID FAST STAINING

PLACE:- INDIRA GANDHI HOSPITAL
DATE:-8TH OCTOBER 2022

Hospital visit was organized by Dr. Vidya kathoke Mam. The hospital visit started on time 10pm. We visited a hospital for acid fast staining and a blood bank room. First of all we saw the blood bank room. On the first floor we got the information about blood donation.

Hospitals offered their valuable services for blood donation. In blood Bank room Mam told that how the separate blood components like as plasma, WBCs, RBCs, platelets in Quality control room. we also got the information about blood donor and Recipient (patient). Blood donor Person should be age above 18+ and blood donor person should not be infected for the donation of blood. Before blood donation first of donor should be check B.P and diabetes and sugar test. Blood donor person (Girl) should have hemoglobin 15.

In the blood bank room we saw some machines such as Laminar flow in the refreshment room for patients. After visiting the blood bank room we visited a lab for Acid fast staining. We got information about Acid fast staining occurred in such type of microorganism which have waxy covering in bacterial cell. Due to this covering in bacterial cell Acid fast staining done.

This type of organism do not get decolorized By strong agent. In Acid fast staining some strong reagents into the bacterial cell First of all taken sputum of T.B. patient and made a smear on the slide. Reagents are used such as carbol fushion, H₂SO₄ acid, Methylene blue. In Acid fast staining

Mycobacterium colonies detected which is red coloured rod shape.

After that we visited the PCR Room where CBNAAT machines were available and in that machine cartridges contained sputum samples and were then placed in CBNAAT machines. CBNAAT machine connected with monitor

and shown the report about T.B. the patient. Machine required a high temperature in a cold room. Monitor displayed report of T.B. patient Negative then Rifampicin drug not given to the patient. If the report of

T.B. is positive i.e. person was infected with T.B. disease. this patient is diagnosed that the body resist Rifampicin or it was sensitized to it. If it resist Rifampicin then second line drugs was given for treatment. If it sensitized Rifampicin then 1st line drugs was given for treatment. Two types of patient T.B. patient. 1- pulmonary tract T.B. 2- Extra pulmonary tract TB for diagnosis, x-ray, gene -Expert PCR, True north and is Acid fast Staining is done. Two machines was used for diagnosis CABINET, True nert.

ADVANTAGES OF CABINET OVER TRUE NERT

- 1- There was no manual work carried out in CABINET. Whole process of testing is machine based.
- 2- It had good result accuracy as compared to True nert.

ADVANTAGE OF TRUE NERT OVER CABINET

- 1- CABINET required high temperature AC- Room and true nert was flexible in any temperature it can be shifted to any place for diagnosis and testing
- 2- CABINET was more expensive and true-nert was cheaped but less accuracy to result.

Activity Report

Date: 07/10/2022

Name of Organizing Department or Committee: Department of Physics

Name of the activity: NEP based Demonstration Activity for B.Sc. Sem-V

Suggested CRITERION point if any: Restricted to RTMNU BSc physics syllabus.

Date of Activity: 07/10/2022

Place of Activity: Room no. 004

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA

Title of the Activity: Demonstration Comparison among MB, BE and FD statistics

Activity with newspaper coverage if any: No

Number of Participants: BSc Sem-V Students - 21

Name of the Teacher In-charge / Convener: Mr. Nishant Zode

Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

This demonstration provided a unique opportunity to BSc Sem-V students to learn the comparison among MB, BE and FD statistics. These three statistics concern when how particles occupy a system which consists of several energy levels (and each energy level could also have several energy states). A particle in this system can be in one of those energy levels depending on the energy particle has. It's impossible to have just one particle in a system since in real life it needs various particles to constitute a system. They occupy the levels under a statistics rule

Date: 08/10/2022

Name of Organizing Department or Committee: Department of Physics
Name of the activity: NEP based Demonstration Activity for B.Sc. Sem-I
Suggested CRITERION point if any: Restricted to RTMNU BSc physics syllabus.
Date of Activity: 08/10/2022
Place of Activity: Room No. 004
Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA
Title of the Activity: Designing and construction of atomizer spray
Activity with newspaper coverage if any: No
Number of Participants: BSc Sem-I Students - 10
Name of the Teacher In-charge / Convener: Mr. Nikhil Somkule
Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

This demonstration provided a unique opportunity to BSc Sem-I students to learn the application of Bernoulli's principle. In this activity a perfume bottle was dismantled and various parts of atomizer were viewed. In the atomizer a capillary tube is dipped in a liquid and air is blown at high speed over the tip of the tube. This high-speed air creates a low pressure over the vertical tube, due to which the liquid rises in it and is then blown off in very small droplets with expelled air.

Name of the Teacher In-charge / Convener: Mr. Roshan B. Raut

Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

This demonstration provided BSc Sem-I students to learn the Dielectrics and surface area dependent capacitance. In this activity a piece of aluminium foil was rolled in cylindrical shape and connect two electrodes form a capacitor. On other hand a piece of aluminium foil was rolled with Lab synthesize dielectric material in cylindrical shape and connect two electrodes form a capacitor with dielectric. Both the capacitors were charged and discharge through LED and observed the charge storage capacity. This demonstration helped students to understand the concept of Dielectrics and surface area dependent capacitance. The activity was also repeated for a rectangular plate type capacitors.

Date:03/11/2022

Name of Organizing Department or Committee: Department of Physics

Name of the activity: NEP based Demonstration Activity for B.Sc. Sem-I

Suggested CRITERION point if any: Restricted to RTMNU BSc physics syllabus.

Date of Activity: 03/11/2022

Place of Activity: Physics laboratory

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA

Title of the Activity: Demonstration of surface tension in different diameter capillaries

Activity with newspaper coverage if any: No

Number of Participants: BSc Sem-I Students – 10

Name of the Teacher In-charge / Convener: Mr. Nikhil Somkule

Names of other Committee Members / Staff: N.A.

OUTCOME of the Activity with respect to academics:

In this demonstration of surface tension, three capillaries of different diameters (0.5 mm, 1.0 mm and 2.0 mm) of same material (glass) were used. All the capillaries were dipped in the same liquid (water) simultaneously and the height of the liquid rise in the capillaries were observed. OUTCOME of the Activity with respect to academics:

This demonstration was done to show the students the principle of conservation of linear momentum. It states that, "When no external force act on the bodies, then linear momentum is conserved. i.e., Momentum before collision = Momentum after collision". In this demo two pebbles of same mass, size and shape were used, one was kept stationary on the ground and the other was used to strike the first pebble head on. After the collision it was observed that, the first pebble stopped and the second pebble gained the initial velocity of the first pebble, thus confirming the principle of conservation of linear momentum.

Activity Report

Date: 17/11/2022

Name of Organizing Department or Committee: Department of Physics
Name of the activity: NEP based Demonstration Activity for B.Sc. Sem-V
Suggested CRITERION point if any: Restricted to RTMNU BSc physics syllabus.
Date of Activity: 17/11/2022
Place of Activity: Room no. 004
Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA
Title of the Activity: Demonstration Average, RMS, MP distribution using Maxwell's concept
Activity with newspaper coverage if any: No
Number of Participants: BSc Sem-V Students - 13
Name of the Teacher In-charge / Convener: Mr. Nishant Zode
Names of other Committee Members / Staff: N.A.
OUTCOME of the Activity with respect to academics:

The students were made to learn the Analogical Average, RMS, MP distribution using Maxwell's Concept. If we were to plot the number of molecules whose velocities fall within a series of narrow ranges, we would obtain a slightly asymmetric curve known as a velocity distribution. The peak of this curve would correspond to the most probable velocity. This velocity distribution curve is known as the Maxwell-Boltzmann distribution, but is frequently referred to only by Boltzmann's name.

Note: 3. Measured under thermal equilibrium and dc (I_{ZT}) test conditions.

4. The Zener impedance is derived from the 60 Hz ac voltage which results when an ac current having an rms value equal to 10% of the Zener current (I_{ZT} or I_{ZK}) is superimposed on I_{ZT} or I_{ZK}. Zener impedance is measured at two points to insure a sharp knee on the breakdown curve and to eliminate unstable units.

Names of other Committee Members / Staff: Dr. Mrs. V. P. Meshram

OUTCOME of the Activity with respect to mission vision of the institute and or academics: This is a student's centric activity. Crystal structure is obtained by attaching atoms, group of atoms or molecules. It is formed by constituent particles to produce symmetric patterns. Model making help students to understand the concept of repeating pattern of atomic structure called unit cell, which is a building block of crystal structure. They got the information about crystal structure and symmetry. They can differentiate between length, edges of principal axes and angle between the unit cell which are called as lattice constants.

August 1997

Features

- 80C48 and 80C80/85 Bus Compatible - No Interfacing Logic Required
- Conversion Time < 100 μ s
- Easy Interface to Most Microprocessors
- Will Operate in a "Stand Alone" Mode
- Differential Analog Voltage Inputs
- Works with Bandgap Voltage References
- TTL Compatible Inputs and Outputs
- On-Chip Clock Generator
- 0V to 5V Analog Voltage Input Range (Single +5V Supply)
- No Zero-Adjust Required

Description

The ADC0802 family are CMOS 8-Bit, successive-approximation A/D converters which use a modified potentiometric ladder and are designed to operate with the 8080A control bus via three-state outputs. These converters appear to the processor as memory locations or I/O ports, and hence no interfacing logic is required.

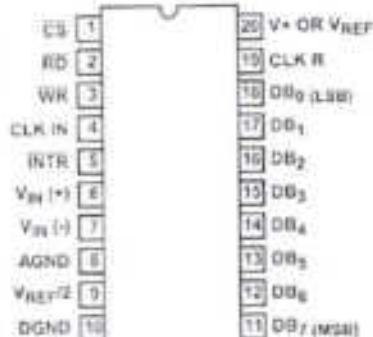

The differential analog voltage input has good common-mode-rejection and permits offsetting the analog zero-input-voltage value. In addition, the voltage reference input can be adjusted to allow encoding any smaller analog voltage span to the full 8 bits of resolution.

NOTES

- All voltages are measured with respect to GND, unless otherwise specified. The separate AGND point should always be wired to the DGND, being careful to avoid ground loops.
- For $V_{IN(i)} \geq V_{IN(j)}$ the digital output code will be 0000 0000. Two on-chip diodes are tied to each analog input (see Block Diagram) which will forward conduct for analog input voltages one diode drop below ground or one diode drop greater than the V^+ supply. Be careful during testing at low V^+ levels (4.5V), as high level analog inputs (5V) can cause this input diode to conduct - especially at elevated temperatures, and cause errors for analog inputs near full scale. As long as the analog V_{IN} does not exceed the supply voltage by more than 50mV, the output code will be correct. To achieve an absolute 0V to 5V input voltage range will therefore require a minimum supply voltage of 4.950V over temperature variations, initial tolerance and loading.
- With $V^+ = 5V$, the digital logic interfaces are no longer TTL compatible.
- With an asynchronous start pulse, up to 8 clock periods may be required before the internal clock phases are proper to start the conversion process.
- The \overline{CS} input is assumed to bracket the \overline{WR} strobe input so that timing is dependent on the \overline{WR} pulse width. An arbitrarily wide pulse width will hold the converter in a reset mode and the start of conversion is initiated by the low to high transition of the \overline{WR} pulse (see Timing Diagrams).
- CLK IN (pin 4) is the input of a Schmitt trigger circuit and is therefore specified separately.
- None of these A/Ds requires a zero-adjust. However, if an all zero code is desired for an analog input other than 0V, or if a narrow full scale span exists (for example: 0.5V to 4V full scale) the $V_{REF(-)}$ input can be adjusted to achieve this. See the Zero Error description in this data sheet.

Timing Diagrams

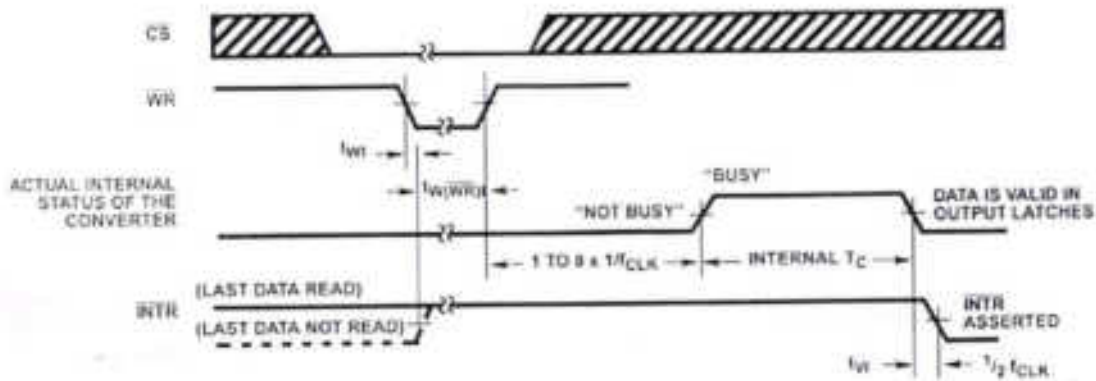

FIGURE 10A. START CONVERSION

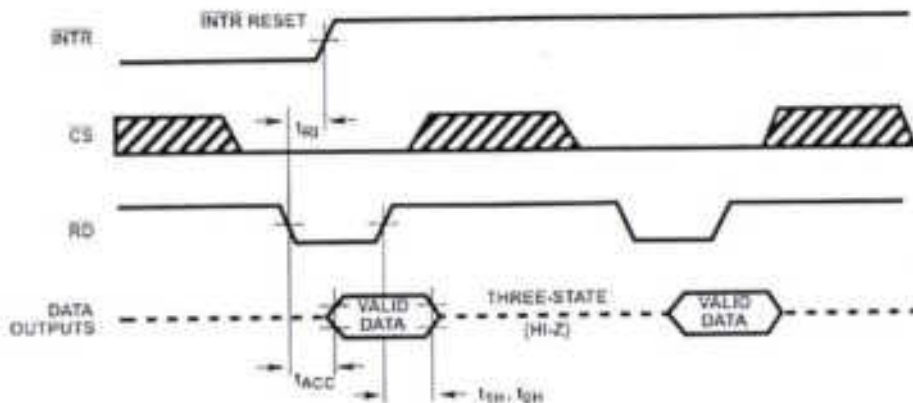

FIGURE 10B. OUTPUT ENABLE AND RESET INTR

The device may be operated in the free-running mode by connecting INTR to the WR input with CS = 0. To ensure start-up under all possible conditions, an external WR pulse is required during the first power-up cycle. A conversion-in-progress can be interrupted by issuing a second start command.

Digital Operation

The converter is started by having CS and WR simultaneously low. This sets the start flip-flop (F/F) and the resulting "1" level resets the 8-bit shift register, resets the Interrupt (INTR) F/F and inputs a "1" to the D flip-flop, DFF1, which is at the input end of the 8-bit shift register. Internal clock signals then transfer this "1" to the Q output of DFF1. The AND gate, G1, combines this "1" output with a clock signal to provide a reset signal to the start F/F. If the set signal is no longer present (either WR or CS is a "1"), the start F/F is reset and the 8-bit shift register then can have the "1" clocked in, which starts the conversion process. If the set signal were to still be present, this reset pulse would have no effect (both outputs of the start F/F would be at a "1" level) and the 8-bit shift register would continue to be held in the reset mode. This allows for asynchronous or wide CS and WR signals.

After the "1" is clocked through the 8-bit shift register (which completes the SAR operation) it appears as the input to DFF2. As soon as this "1" is output from the shift register, the AND gate, G2, causes the new digital word to transfer to the Three-State output latches. When DFF2 is subsequently clocked, the Q output makes a high-to-low transition which causes the INTR F/F to set. An inverting buffer then supplies the INTR output signal.

When data is to be read, the combination of both CS and RD being low will cause the INTR F/F to be reset and the three-state output latches will be enabled to provide the 8-bit digital outputs.

Digital Control Inputs

The digital control inputs (CS, RD, and WR) meet standard TTL logic voltage levels. These signals are essentially equivalent to the standard A/D Start and Output Enable control signals, and are active low to allow an easy interface to microprocessor control buses. For non-microprocessor based applications, the CS input (pin 1) can be grounded and the standard A/D Start function obtained by an active low pulse at the WR input (pin 3). The Output Enable function is achieved by an active low pulse at the RD input (pin 2).

Analog Operation

The analog comparisons are performed by a capacitive charge summing circuit. Three capacitors (with precise ratioed values) share a common node with the input to an auto-zeroed comparator. The input capacitor is switched between $V_{IN(+)}$ and $V_{IN(-)}$, while two ratioed reference capacitors are switched between taps on the reference voltage divider string. The net charge corresponds to the weighted difference between the input and the current total value set by the successive approximation register. A correction is made to offset the comparison by $1/2$ LSB (see Figure 11A).

Analog Differential Voltage Inputs and Common-Mode Rejection

This A/D gains considerable applications flexibility from the analog differential voltage input. The $V_{IN(-)}$ input (pin 7) can be used

to automatically subtract a fixed voltage value from the input reading (tare correction). This is also useful in 4mA - 20mA current loop conversion. In addition, common-mode noise can be reduced by use of the differential input.

The time interval between sampling $V_{IN(+)}$ and $V_{IN(-)}$ is $4\frac{1}{2}$ clock periods. The maximum error voltage due to this slight time difference between the input voltage samples is given by:

$$\Delta V_E(\text{MAX}) = (V_{\text{PEAK}})(2\pi f_{\text{CM}}) \left[\frac{4.5}{f_{\text{CLK}}} \right]$$

where:

ΔV_E is the error voltage due to sampling delay.

V_{PEAK} is the peak value of the common-mode voltage.

f_{CM} is the common-mode frequency.

For example, with a 60Hz common-mode frequency, f_{CM} , and a 640kHz A/D clock, f_{CLK} , keeping this error to $1/4$ LSB ($\sim 5\text{mV}$) would allow a common-mode voltage, V_{PEAK} , given by:

$$V_{\text{PEAK}} = \frac{[\Delta V_E(\text{MAX}) + f_{\text{CLK}}]}{(2\pi f_{\text{CM}})(4.5)}$$

or

$$V_{\text{PEAK}} = \frac{(5 \times 10^{-3})(640 \times 10^3)}{(6.28)(60)(4.5)} = 1.9\text{V}$$

The allowed range of analog input voltage usually places more severe restrictions on input common-mode voltage levels than this.

An analog input voltage with a reduced span and a relatively large zero offset can be easily handled by making use of the differential input (see Reference Voltage Span Adjust).

Analog Input Current

The internal switching action causes displacement currents to flow at the analog inputs. The voltage on the on-chip capacitance to ground is switched through the analog differential input voltage, resulting in proportional currents entering the $V_{IN(+)}$ input and leaving the $V_{IN(-)}$ input. These current transients occur at the leading edge of the internal clocks. They rapidly decay and do not inherently cause errors as the on-chip comparator is strobed at the end of the clock period.

Input Bypass Capacitors

Bypass capacitors at the inputs will average these charges and cause a DC current to flow through the output resistances of the analog signal sources. This charge pumping action is worse for continuous conversions with the $V_{IN(+)}$ input voltage at full scale. For a 640kHz clock frequency with the $V_{IN(+)}$ input at 5V, this DC current is at a maximum of approximately 5 μA . Therefore, **bypass capacitors should not be used at the analog inputs or the $V_{\text{REF}/2}$ pin** for high resistance sources ($>1\text{k}\Omega$). If input bypass capacitors are necessary for noise filtering and high source resistance is desirable to minimize capacitor size, the effects of the voltage drop across this input resistance, due to the average value of the input current, can be compensated by a full scale adjustment while the given source resistor and input bypass capacitor are both in place. This is possible because the average value of the input current is a precise linear function of the differential input voltage at a constant conversion rate.

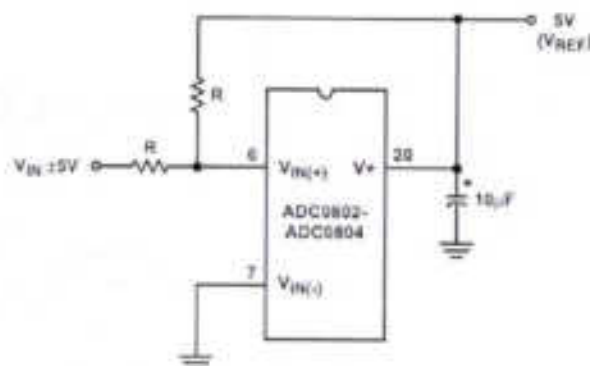

FIGURE 15. HANDLING ±5V ANALOG INPUT RANGE

Reference Accuracy Requirements

The converter can be operated in a pseudo-ratiometric mode or an absolute mode. In ratiometric converter applications, the magnitude of the reference voltage is a factor in both the output of the source transducer and the output of the A/D converter and therefore cancels out in the final digital output code. In absolute conversion applications, both the initial value and the temperature stability of the reference voltage are important accuracy factors in the operation of the A/D converter. For $V_{REF}/2$ voltages of 2.5V nominal value, initial errors of $\pm 10\text{mV}$ will cause conversion errors of ± 1 LSB due to the gain of 2 of the $V_{REF}/2$ input. In reduced span applications, the initial value and the stability of the $V_{REF}/2$ input voltage become even more important. For example, if the span is reduced to 2.5V, the analog input LSB voltage value is correspondingly reduced from 20mV (5V span) to 10mV and 1 LSB at the $V_{REF}/2$ input becomes 5mV. As can be seen, this reduces the allowed initial tolerance of the reference voltage and requires correspondingly less absolute change with temperature variations. Note that spans smaller than 2.5V place even tighter requirements on the initial accuracy and stability of the reference source.

In general, the reference voltage will require an initial adjustment. Errors due to an improper value of reference voltage appear as full scale errors in the A/D transfer function. IC voltage regulators may be used for references if the ambient temperature changes are not excessive.

Zero Error

The zero of the A/D does not require adjustment. If the minimum analog input voltage value, $V_{IN(MIN)}$, is not ground, a zero offset can be done. The converter can be made to output 0000 0000 digital code for this minimum input voltage by biasing the A/D $V_{IN(-)}$ input at this $V_{IN(MIN)}$ value (see Applications section). This utilizes the differential mode operation of the A/D.

The zero error of the A/D converter relates to the location of the first riser of the transfer function and can be measured by grounding the $V_{IN(-)}$ input and applying a small magnitude positive voltage to the $V_{IN(+)}$ input. Zero error is the difference between the actual DC input voltage which is necessary to just cause an output digital code transition from 0000 0000 to 0000 0001 and the ideal $1/2$ LSB value ($1/2$ LSB = 9.8mV for $V_{REF}/2 = 2.500\text{V}$).

Full Scale Adjust

The full scale adjustment can be made by applying a differential input voltage which is $1/2$ LSB down from the desired analog full scale voltage range and then adjusting the magnitude of the $V_{REF}/2$ input (pin 9) for a digital output code which is just changing from 1111 1110 to 1111 1111. When offsetting the zero and using a span-adjusted $V_{REF}/2$ voltage, the full scale adjustment is made by inputting V_{MIN} to the $V_{IN(-)}$ input of the A/D and applying a voltage to the $V_{IN(+)}$ input which is given by:

$$V_{IN(+)} f_{SADJ} = V_{MAX} - 1.5 \left[\frac{(V_{MAX} - V_{MIN})}{256} \right]$$

where:

V_{MAX} = the high end of the analog input range.

and

V_{MIN} = the low end (the offset zero) of the analog range. (Both are ground referenced.)

Clocking Option

The clock for the A/D can be derived from an external source such as the CPU clock or an external RC network can be added to provide self-clocking. The CLK IN (pin 4) makes use of a Schmitt trigger as shown in Figure 16.

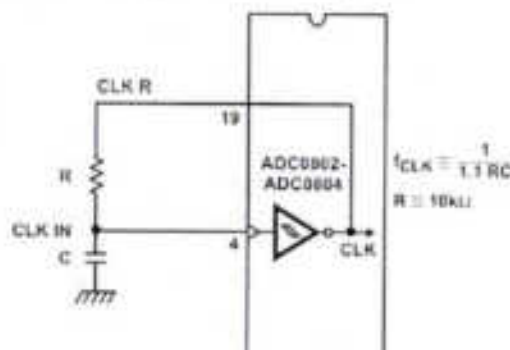

FIGURE 16. SELF-CLOCKING THE A/D

Heavy capacitive or DC loading of the CLK R pin should be avoided as this will disturb normal converter operation. Loads less than 50pF, such as driving up to 7 A/D converter clock inputs from a single CLK R pin of 1 converter, are allowed. For larger clock line loading, a CMOS or low power TTL buffer or PNP input logic should be used to minimize the loading on the CLK R pin (do not use a standard TTL buffer).

Restart During a Conversion

If the A/D is restarted (\overline{CS} and \overline{WR} go low and return high) during a conversion, the converter is reset and a new conversion is started. The output data latch is not updated if the conversion in progress is not completed. The data from the previous conversion remain in this latch.

Continuous Conversions

In this application, the \overline{CS} input is grounded and the \overline{WR} input is tied to the \overline{INTR} output. This \overline{WR} and \overline{INTR} node should be momentarily forced to logic low following a power-up cycle to insure circuit operation. See Figure 17 for details.

Figures 19 and 20 show more sophisticated test circuits.

Typical Applications

Interfacing 8080/85 or Z-80 Microprocessors

This converter has been designed to directly interface with 8080/85 or Z-80 Microprocessors. The three-state output capability of the A/D eliminates the need for a peripheral interface device, although address decoding is still required to generate the appropriate \overline{CS} for the converter. The A/D can be mapped into memory space (using standard memory-address decoding for \overline{CS} and the \overline{MEMR} and \overline{MEMW} strobes) or it can be controlled as an I/O device by using the \overline{IOR} and \overline{IOW} strobes and decoding the address bits A0 → A7 (or address bits A8 → A15, since they will contain the same 8-bit address information) to obtain the \overline{CS} input. Using the I/O space provides 256 additional addresses and may allow a simpler 8-bit address decoder, but the data can only be input to the accumulator. To make use of the additional memory reference instructions, the A/D should be mapped into memory space. See AN020 for more discussion of memory-mapped vs I/O-mapped interfaces. An example of an A/D in I/O space is shown in Figure 21.

The standard control-bus signals of the 8080 (CS, RD and WR) can be directly wired to the digital control inputs of the A/D, since the bus timing requirements, to allow both starting the converter, and outputting the data onto the data bus, are met. A bus driver should be used for larger microprocessor systems where the data bus leaves the PC board and/or must drive capacitive loads larger than 100pF.

It is useful to note that in systems where the A/D converter is 1 of 8 or fewer I/O-mapped devices, no address-decoding circuitry is necessary. Each of the 8 address bits (A0 to A7) can be directly used as \overline{CS} inputs, one for each I/O device.

Interfacing the Z-80 and 8085

The Z-80 and 8085 control buses are slightly different from that of the 8080. General RD and WR strobes are provided and separate memory request, \overline{MREQ} , and I/O request, \overline{IORQ} , signals have to be combined with the generalized strobes to provide the appropriate signals. An advantage of operating the A/D in I/O space with the Z-80 is that the CPU will automatically insert one wait state (the RD and WR strobes are extended one clock period) to allow more time for the I/O devices to respond. Logic to map the A/D in I/O space is shown in Figure 22. By using \overline{MREQ} in place of \overline{IORQ} , a memory-mapped configuration results.

Additional I/O advantages exist as software DMA routines are available and use can be made of the output data transfer which exists on the upper 8 address lines (A8 to A15) during I/O input instructions. For example, MUX channel selection for the A/D can be accomplished with this operating mode.

The 8085 also provides a generalized RD and WR strobe, with an I/O/M line to distinguish I/O and memory requests. The circuit of Figure 22 can again be used, with I/O/M in place of \overline{IORQ} for a memory-mapped interface, and an extra inverter (or the logic equivalent) to provide I/O/M for an I/O-mapped connection.

Interfacing 6800 Microprocessor Derivatives (6502, etc.)

The control bus for the 6800 microprocessor derivatives does not use the RD and WR strobe signals. Instead it employs a single R/W line and additional timing, if needed, can be derived from the $\phi 2$ clock. All I/O devices are memory-mapped in the 6800 system, and a special signal, VMA, indicates that the current address is valid. Figure 23 shows an interface schematic where the A/D is memory-mapped in the 6800 system. For simplicity, the CS decoding is shown using $1/2$ DM8092. Note that in many 6800 systems, an already decoded $4/5$ line is brought out to the common bus at pin 21. This can be tied directly to the CS pin of the A/D, provided that no other devices are addressed at HEX ADDR: 4XXX or 5XXX.

In Figure 24 the ADC0802 series is interfaced to the MC6800 microprocessor through (the arbitrarily chosen) Port B of the MC6820 or MC6821 Peripheral Interface Adapter (PIA). Here the CS pin of the A/D is grounded since the PIA is already memory-mapped in the MC6800 system and no CS decoding is necessary. Also notice that the A/D output data lines are connected to the microprocessor bus under program control through the PIA and therefore the A/D RD pin can be grounded.

Driving the Data Bus

This CMOS A/D, like MOS microprocessors and memories, will require a bus driver when the total capacitance of the data bus gets large. Other circuitry, which is tied to the data bus, will add to the total capacitive loading, even in three-state (high-impedance mode). Back plane bussing also greatly adds to the stray capacitance of the data bus.

There are some alternatives available to the designer to handle this problem. Basically, the capacitive loading of the data bus slows down the response time, even though DC specifications are still met. For systems operating with a relatively slow CPU clock frequency, more time is available in which to establish proper logic levels on the bus and therefore higher capacitive loads can be driven (see Typical Performance Curves).

At higher CPU clock frequencies time can be extended for I/O reads (and/or writes) by inserting wait states (8080) or using clock-extending circuits (6800).

Finally, if time is short and capacitive loading is high, external bus drivers must be used. These can be three-state buffers (low power Schottky is recommended, such as the 74LS240 series) or special higher-drive-current products which are designed as bus drivers. High-current bipolar bus drivers with PNP inputs are recommended.

Power Supplies

Noise spikes on the V+ supply line can cause conversion errors as the comparator will respond to this noise. A low-inductance tantalum filter capacitor should be used close to the converter V+ pin, and values of 1µF or greater are recommended. If an unregulated voltage is available in the system, a separate 5V voltage regulator for the converter (and other analog circuitry) will greatly reduce digital noise on the V+ supply. An ICL7663 can be used to regulate such a supply from an input as low as 5.2V.

Wiring and Hook-Up Precautions

Standard digital wire-wrap sockets are not satisfactory for breadboarding with this A/D converter. Sockets on PC boards can be used. All logic signal wires and leads should be grouped and kept as far away as possible from the analog

signal leads. Exposed leads to the analog inputs can cause undesired digital noise and hum pickup; therefore, shielded leads may be necessary in many applications.

A single-point analog ground should be used which is separate from the logic ground points. The power supply bypass capacitor and the self-clocking capacitor (if used) should both be returned to digital ground. Any VREF/2 bypass capacitors, analog input filter capacitors, or input signal shielding should be returned to the analog ground point. A test for proper grounding is to measure the zero error of the A/D converter. Zero errors in excess of 1/2 LSB can usually be traced to improper board layout and wiring (see Zero Error for measurement). Further information can be found in Application Note AN018.

Testing the A/D Converter

There are many degrees of complexity associated with testing an A/D converter. One of the simplest tests is to apply a known analog input voltage to the converter and use LEDs to display the resulting digital output code as shown in Figure 18.

For ease of testing, the VREF/2 (pin 9) should be supplied with 2.560V and a V+ supply voltage of 5.12V should be used. This provides an LSB value of 20mV.

If a full scale adjustment is to be made, an analog input voltage of 5.090V (5.120 - 1 1/2 LSB) should be applied to the VIN(+) pin with the VIN(-) pin grounded. The value of the VREF/2 input voltage should be adjusted until the digital output code is just changing from 1111 1110 to 1111 1111. This value of VREF/2 should then be used for all the tests.

The digital-output LED display can be decoded by dividing the 8 bits into 2 hex characters, one with the 4 most-significant bits (MS) and one with the 4 least-significant bits (LS). The output is then interpreted as a sum of fractions times the full scale voltage:

$$V_{OUT} = \left(\frac{MS}{16} + \frac{LS}{256} \right) (5.12) V$$

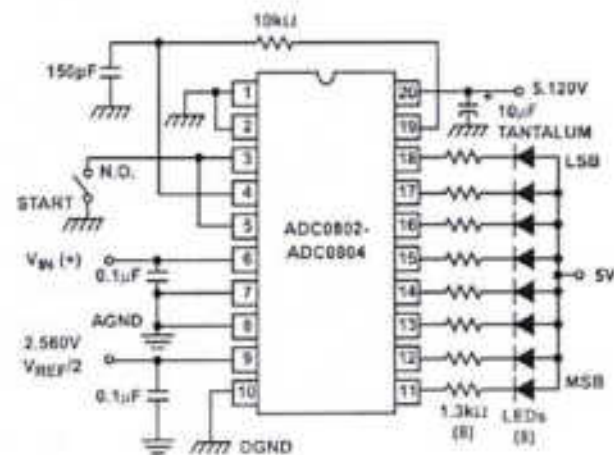

FIGURE 18. BASIC TESTER FOR THE A/D

For example, for an output LED display of 1011 0110, the MS character is hex B (decimal 11) and the LS character is hex (and decimal) 6, so

$$V_{OUT} = \left(\frac{11}{16} + \frac{6}{256} \right) (5.12) = 3.64V$$

Input Source Resistance

Large values of source resistance where an input bypass capacitor is not used will not cause errors since the input currents settle out prior to the comparison time. If a low-pass filter is required in the system, use a low-value series resistor ($\leq 1k\Omega$) for a passive RC section or add an op amp RC active low-pass filter. For low-source-resistance applications ($\leq 1k\Omega$), a $0.1\mu F$ bypass capacitor at the inputs will minimize EMI due to the series lead inductance of a long wire. A 100Ω series resistor can be used to isolate this capacitor (both the R and C are placed outside the feedback loop) from the output of an op amp, if used.

Stray Pickup

The leads to the analog inputs (pins 6 and 7) should be kept as short as possible to minimize stray signal pickup (EMI). Both EMI and undesired digital-clock coupling to these inputs can cause system errors. The source resistance for these inputs should, in general, be kept below $5k\Omega$. Larger values of source resistance can cause undesired signal pickup. Input bypass capacitors, placed from the analog inputs to ground, will eliminate this pickup but can create analog scale errors as these capacitors will average the transient input switching currents of the A/D (see Analog Input Current). This scale error depends on both a large source resistance and the use of an input bypass capacitor. This error can be compensated by a full scale adjustment of the A/D (see Full Scale Adjustment) with the source resistance and input bypass capacitor in place, and the desired conversion rate.

Reference Voltage Span Adjust

For maximum application flexibility, these A/Ds have been designed to accommodate a 5V, 2.5V or an adjusted voltage reference. This has been achieved in the design of the IC as shown in Figure 12.

Notice that the reference voltage for the IC is either $1/2$ of the voltage which is applied to the $V+$ supply pin, or is equal to the voltage which is externally forced at the $V_{REF}/2$ pin. This allows for a pseudo-ratiometric voltage reference using, for the $V+$ supply, a 5V reference voltage. Alternatively, a voltage less than 2.5V can be applied to the $V_{REF}/2$ input. The internal gain to the $V_{REF}/2$ input is 2 to allow this factor of 2 reduction in the reference voltage.

Such an adjusted reference voltage can accommodate a reduced span or dynamic voltage range of the analog input voltage. If the analog input voltage were to range from 0.5V to 3.5V, instead of 0V to 5V, the span would be 3V. With 0.5V applied to the $V_{IN(-)}$ pin to absorb the offset, the reference voltage can be made equal to $1/2$ of the 3V span or 1.5V. The A/D now will encode the $V_{IN(+)}$ signal from 0.5V to 3.5V with the 0.5V input corresponding to zero and the 3.5V input corresponding to full scale. The full 8 bits of resolution are therefore applied over this reduced analog input voltage range. The requisite connections are shown in Figure 13. For expanded scale inputs, the circuits of Figures 14 and 15 can be used.

Understanding A/D Error Specs

A perfect A/D transfer characteristic (staircase wave-form) is shown in Figure 11A. The horizontal scale is analog input voltage and the particular points labeled are in steps of 1 LSB (19.53mV with 2.5V tied to the $V_{REF}/2$ pin). The digital output codes which correspond to these inputs are shown as D-1, D, and D+1. For the perfect A/D, not only will center-value (A-1, A, A+1, ...) analog inputs produce the correct output digital codes, but also each riser (the transitions between adjacent output codes) will be located $\pm 1/2$ LSB away from each center-value. As shown, the risers are ideal and have no width. Correct digital output codes will be provided for a range of analog input voltages which extend $\pm 1/2$ LSB from the ideal center-values. Each tread (the range of analog input voltage which provides the same digital output code) is therefore 1 LSB wide.

The error curve of Figure 11B shows the worst case transfer function for the ADC0802. Here the specification guarantees that if we apply an analog input equal to the LSB analog voltage center-value, the A/D will produce the correct digital code.

Next to each transfer function is shown the corresponding error plot. Notice that the error includes the quantization uncertainty of the A/D. For example, the error at point 1 of Figure 11A is $+1/2$ LSB because the digital code appeared $1/2$ LSB in advance of the center-value of the tread. The error plots always have a

constant negative slope and the abrupt upside steps are always 1 LSB in magnitude, unless the device has missing codes.

Detailed Description

The functional diagram of the ADC0802 series of A/D converters operates on the successive approximation principle (see Application Notes AN016 and AN020 for a more detailed description of this principle). Analog switches are closed sequentially by successive-approximation logic until the analog differential input voltage [$V_{IN(+)} - V_{IN(-)}$] matches a voltage derived from a tapped resistor string across the reference voltage. The most significant bit is tested first and after 8 comparisons (64 clock cycles), an 8-bit binary code (1111 1111 = full scale) is transferred to an output latch.

The normal operation proceeds as follows. On the high-to-low transition of the WR input, the internal SAR latches and the shift-register stages are reset, and the INTR output will be set high. As long as the CS input and WR input remain low, the A/D will remain in a reset state. Conversion will start from 1 to 8 clock periods after at least one of these inputs makes a low-to-high transition. After the requisite number of clock pulses to complete the conversion, the INTR pin will make a high-to-low transition. This can be used to interrupt a processor, or otherwise signal the availability of a new conversion. A RD operation (with CS low) will clear the INTR line high again.

Suggested CRITERION point if any: Criterion I.

Date of Activity: 23/02/2023

Place of Activity: Class room

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA

Title of the Activity: Short note on the work of Mathematician (Daniel Bernoulli's)

OUTCOME of the Activity with respect to academics:

Daniel Bernoulli was a Dutch-born member of the Swiss mathematical family. His most important work considered the basic properties of fluid flow, pressure, density and velocity, and gave the Bernoulli principle. If u and v are functions of x , then the Bernoulli's rule is $\int u dv = uv - \int u'v + \int u'v^2 - \dots$. For the following problems we have to apply the integration by parts two or more times to find the solution. In this case Bernoulli's formula helps to find the solution easily

Date:9/03/2023

Name of Organizing Department or Committee: Department of Mathematics

Name of the activity: NEP based To construct new examples on Second order linear differential equations for B.Sc. Semester-II

Suggested CRITERION point if any: Criterion I.

Date of Activity: 9/03/2023

Place of Activity: Class room

Name of Guest Speaker/s or Judge/s or Chief Guest/s if any: NA

Title of the Activity: To construct new examples on Second order linear differential equations

Activity with newspaper coverage if any: No

Number of Participants: B.Sc. Semester-II Students (44)

Name of the Teacher In-charge / Convener: Dr. N. P. Gaikwad

Names of other Committee Members / Staff: Mr.Roshan Thakre

OUTCOME of the Activity with respect to academics:

Second-order linear differential equations have a variety of applications in science and engineering. In this section we explore two of them: the vibration of springs and electric circuits. The theory of second-order partial differential equations has found extensive applications in the study of problems in fluid mechanics, flow in porous media, heat conduction in solids, diffusive transport of chemicals in porous media, wave propagation in strings and membranes, and in mechanics of solids.

CD4001BC/CD4011BC

Quad 2-Input NOR Buffered B Series Gate • Quad 2-Input NAND Buffered B Series Gate

General Description

The CD4001BC and CD4011BC quad gates are monolithic complementary MOS (CMOS) integrated circuits constructed with N- and P-channel enhancement mode transistors. They have equal source and sink current capabilities and conform to standard B series output drive. The devices also have buffered outputs which improve transfer characteristics by providing very high gain.

All inputs are protected against static discharge with diodes to V_{DD} and V_{SS} .

Features

- Low power TTL
- Fan out of 2 driving 74L compatibility or 1 driving 74LS
- 5V–10V–15V parametric ratings
- Symmetrical output characteristics
- Maximum input leakage 1 μ A at 15V over full temperature range

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $GND \leq (V_{in} \text{ or } V_{out}) \leq V_{CC}$. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

†Dorating — SOIC Package: - 7 mW/°C from 65° to 125°C
TSSOP Package: - 6.1 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the ON Semiconductor High-Speed CMOS Data Book (DL129/D).

Names of other Committee Members / Staff: Ms. Ankita Wankhede

OUTCOME of the Activity with respect to mission vision of the institute and or academics:

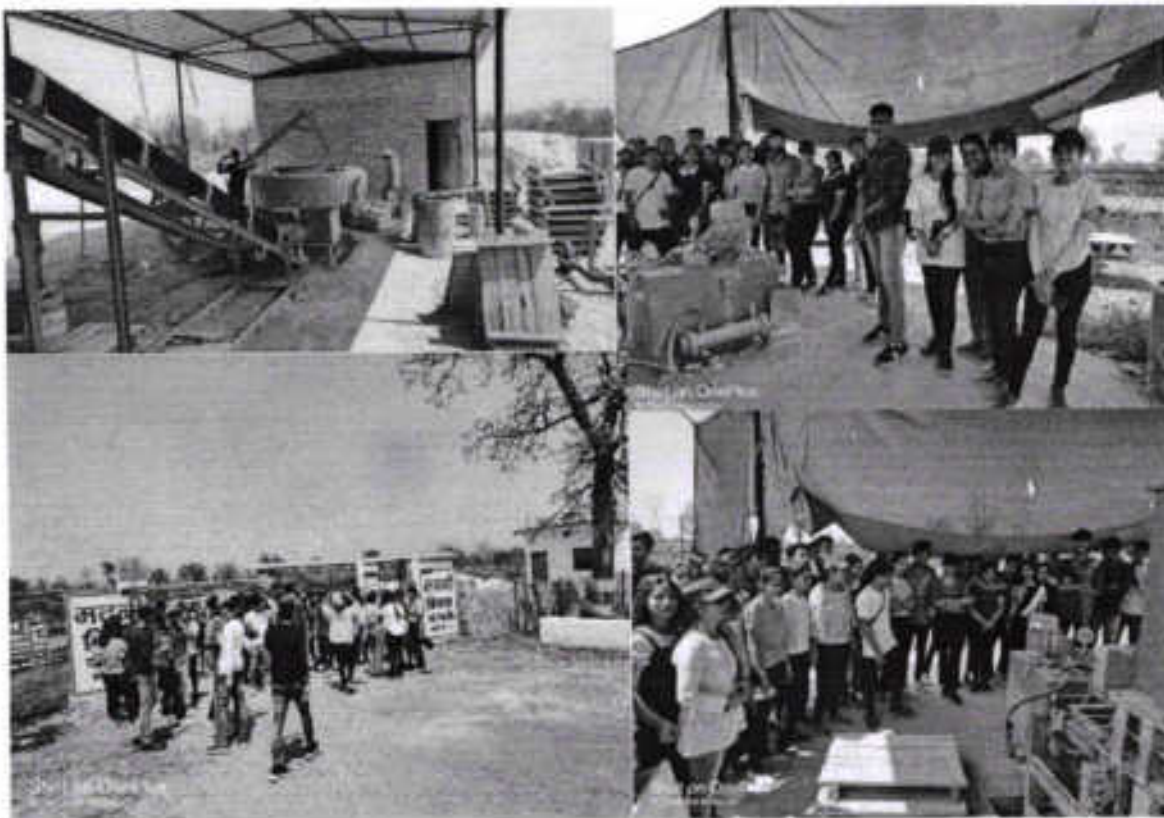

The participants got a new insight in to the working of use of Fly Ash which is a biproduct of coal burning at the Thermal Power station. The mixture of Fly Ash with Sand and a little amount of Cement with water was mixed in proper ratio and after a homogeneous mixture having appropriate moisture it was transferred to the pressing machine via a conveyer belt. The bricks were immediately transferred and stacked on one layer over other. They are then dried naturally and cured further for its better strength.

The main advantage of the process is to provide a quality, environment friendly bricks in short time as compared with the clay bricks which has a very tedious process and harmful to the ecosystem. The students were also happy to see the 400 years old fort made by the Gond King, the Ambagarh and Chandpur lake and natural beauty which are nearby Tumsar, Bhandara

SN74LS76A

Dual JK Flip-Flop with Set and Clear

The SN74LS76A offers individual J, K, Clock Pulse, Direct Set and Direct Clear inputs. These dual flip-flops are designed so that when the clock goes HIGH, the inputs are enabled and data will be accepted. The Logic Level of the J and K inputs will perform according to the Truth Table as long as minimum set-up times are observed. Input data is transferred to the outputs on the HIGH-to-LOW clock transitions.

MODE SELECT - TRUTH TABLE

OPERATING MODE	INPUTS				OUTPUTS	
	S_D	C_D	J	K	Q	\bar{Q}
Set	L	H	X	X	H	L
Reset (Clear)	H	L	X	X	L	H
*Undetermined	L	L	X	X	H	H
Toggle	H	H	h	h	q	\bar{q}
Load "0" (Reset)	H	H	l	h	L	H
Load "1" (Set)	H	H	h	l	H	L
Hold	H	H	l	l	q	\bar{q}

* Both outputs will be HIGH while both S_D and C_D are LOW, but the output states are unpredictable if S_D and C_D go HIGH simultaneously.

H, h = HIGH Voltage Level

L, l = LOW Voltage Level

X = Don't Care

h, l (i) - Lower case letters indicate the state of the referenced input (or output) one setup time prior to the HIGH-to-LOW clock transition

description

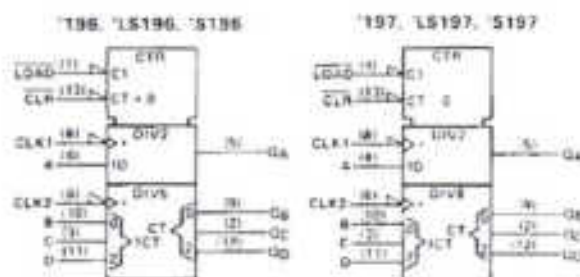

These high-speed monolithic counters consist of four d-c-coupled, master-slave flip-flops, which are internally interconnected to provide either a divide-by-two and a divide-by-five counter ('196, 'LS196, 'S196) or a divide-by-two and a divide-by-eight counter ('197, 'LS197, 'S197). These four counters are fully programmable; that is, the outputs may be preset to any state by placing a low on the count/load input and entering the desired data at the data inputs. The outputs will change to agree with the data inputs independent of the state of the clocks.

During the count operation, transfer of information to the outputs occurs on the negative-going edge of the clock pulse. These counters feature a direct clear which when taken low sets all outputs low regardless of the states of the clocks.

These counters may also be used as 4-bit latches by using the count/load input as the strobe and entering data at the data inputs. The outputs will directly follow the data inputs when the count/load is low, but will remain unchanged when the count/load is high and the clock inputs are inactive.

All inputs are diode-clamped to minimize transmission-line effects and simplify system design. These circuits are compatible with most TTL logic families. Series 54, 54LS, and 54S circuits are characterized for operation over the full military temperature range of -55°C to 125°C. Series 74, 74LS, and 74S circuits are characterized for operation from 0°C to 70°C.

DM5490/DM7490A, DM7493A Decade and Binary Counters

General Description

Each of these monolithic counters contains four master-slave flip-flops and additional gating to provide a divide-by-two counter and a three-stage binary counter for which the count cycle length is divide-by-five for the 90A and divide-by-eight for the 93A.

All of these counters have a gated zero reset and the 90A also has gated set-to-nine inputs for use in BCD nine's complement applications.

To set their maximum count length (decade or four-bit binary), the \bar{B} input is connected to the Q_A output. The input count pulses are applied to input A and the outputs are as

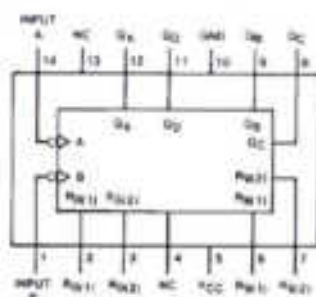

described in the appropriate truth table. A symmetrical divide-by-ten count can be obtained from the 90A counters by connecting the Q_D output to the A input and applying the input count to the B input which gives a divide-by-ten square wave at output Q_A .

Features

- Typical power dissipation
 - 90A 145 mW
 - 93A 130 mW
- Count frequency 42 MHz
